Now, 3 clinically validated tests bring greater diagnostic certainty

The molecular and biomarker-based tests in the Roche Cervical Cancer Portfolio bring greater diagnostic certainty to cervical cancer screening so the results you provide can guide clinicians and women along each step, removing ambiguity that can arise in current testing approaches.

Only the Roche Cervical Cancer Portfolio covers the entire spectrum of screening, triage, and diagnostic solutions

CINtec® PLUS Cytology more clearly stratifies disease risk in HPV-positive patients

Not every HPV-positive woman will develop cervical cancer, so triage can determine who is most at risk and will benefit from more immediate follow-up, and who is at low risk and can be given more time to clear the infection on her own.

CINtec PLUS is a triage cytology test that helps stratify disease risk immediately, giving clinicians confidence when selecting the appropriate management for women at every level of risk. CINtec PLUS Cytology can help more clearly stratify HPV-positive patients into high risk vs low risk follow-up scenarios.

Pap/HPV co-testing (age 30-65)

*For HPV16/18+ use as additional information in conjunction with the physician's assessment of patient screening history, other risk factors, and professional guidelines to guide patient management.

hr = high risk

CINtec PLUS Cytology informs better risk stratification for cervical cancer screening

- **Finds more disease** in HPV-positive women, regardless of HPV genotype, vaccination status,¹ or patient age
- A negative CINtec PLUS Cytology result **substantially lowers the risk** of remaining undetected disease in HPV-positive women
- Provides greater confidence to clinicians about choosing the right management path for their patients when **resolving inconclusive co-testing results**
- **Offers greater reassurance** for those women who are told to come back for re-testing
